Microsoft Teams Summary

Merely put, Microsoft Teams is a collaboration tool that has become essential to remote work. It offers shared spaces for hanging out with colleagues, working on particular projects, and participating in video and voice meetings. The application is incredibly powerful, such that it lets you design and deploy applications right alongside the chats.

Now, there're many reasons why Microsoft Teams has undergone a tremendous rise, whereby it has outgrown its predecessors. Probably, the reason for this is Microsoft's strong emphasis on compatibility. Today, you can use this collaboration software on almost any platform, from Mac and Windows desktops to iOS and Android smartphones.

Microsoft Teams for iOS brings the application's desktop features to a smartphone, with several useful capabilities included. Ideally, Teams comes with three experiences – a desktop client, a web portal and a mobile application.

Teams for iOS is incredibly popular and have garnered hundreds of thousands of reviews on the App Store. Perhaps the reason for the good rating is that Microsoft continuously updates the application, paying equal emphasis to both iOS and Android versions. The current version allows you to invite link support, add folders or files to channels and use a virtual hand-raise to draw the host's attention. ## Key Features

Text, Chat and Video Call

Teams allow you to stay connected with your friends and colleagues via messaging and video calling. You can also create groups to call and chat so you can get in touch with your family if you work in another state. Basically, Teams main objective is to become the number one messaging hub for all your chats, voice and video calls while using fun features, such as photos, GIFs, videos, documents or even locations.

Sharing

Teams integrate with other apps to make it easy for you to work straight from the application. And because your files are stored in a cloud storage device, you can easily access these files from various devices.

Other essential features include:

- * Connect Teams with iOS productivity controls – if you want to mute Teams notifications for a particular period to guarantee perfect work-life balance, you can easily set quiet hours and days.

As expected, the Teams desktop-based application outperforms the iOS app.
